## AUTOLOCK™

### **You do away with all the fine adjustment...**

Set roughly to an approximate figure. The search system then does the rest. And it does so significantly quicker, and more accurately, than a human being.

*You do away with irritating end positions. You avoid locking and unlocking. You avoid the constant, recurrent knob-turning for vertical and horizontal fine adjustment.*

### **...and you avoid the majority of all focusing.**

Simple, easy and no smarting, red eyes from mid-day onwards.

### **You never risk the instrument measuring against the wrong object**

Passive search systems can read and measure against anything which glitters. AUTOLOCK™ has a unique active search system, which means that the instrument does not accept other reflexes than those coming from our active RMT (Remote Positioning Target).

*Even if you try your utmost, you cannot get the instrument to measure against anything other than the RMT reflector.*

### **Working in the dark is no problem.**

AUTOLOCK™ works just as well in darkness as in daylight. You can also use the instrument right round the clock if necessary. When you buy, you also receive Tracklight® – the practical, effective guide light.

### **You get a significantly better working environment.**

Nowadays we know that constant turning on a total station can result in industrial injuries.

If you can avoid fine installation and focusing then you also reduce the risks. Not to mention all the other ergonomic and comfort advantages offered by Geodimeter 600 Systems.

**AUTOLOCK increase your productivity by 50% from the very first day!**
